CPS: Detecting the Receiver

Typically teachers need to plug in the CPS receiver *before* they turn on their laptops in order for it to communicate with the computer. (This is especially true for people using the infrared remotes and have the receivers that look like little UFO spaceships.) However, there is a way around this. If you find that you accidentally turned on your laptop first and the laptop won’t recognize the receiver, follow these directions to troubleshoot the problem:

1. On the top menu, choose “Settings” and “Delivery Options”.

2. On the Delivery Options window, click the “Receiver” tab. Then click the button that says, “Detect CPS Receiver”.

3. When the computer detects the receiver, click “OK” and proceed with your CPS lesson.
